FIGURE 4

APPROXIMATE LOCATIONS OF METALLIC FRAGMENTS
SEEN IN A-P X-RAY OF THE PRESIDENT'S HEAD
(Skull Damage Not Depicted)

The sizable fragments (A' and B') seen above the right orbit appear to correspond to those noted in the lateral X-ray at the rear and front of the skull.

In this view, the smaller particles appear widely dispersed laterally, suggesting that the "track" seen in the lateral X-ray may be somewhat of an illusion caused by lack of depth perception. This shows the need for sectioning of the brain. Note that a few very small particles are visible even on the left side of the President's head.

There is the appearance of a very small particle on the right side of the mandible near the midline. No density corresponding to this location is seen on the lateral X-ray. Its location could be in the region of the spinal column and thus relate to the President's back wound.
